DriverExtractor Torrent (Activation Code) [32|64bit]

Driver Backup is an advanced tool, which helps you to create backups of installed drivers. There is no need to reinstall your computer, nor to purchase the necessary software. Drivers are saved on a portable flash drive, created through simple clicks and then updated to your computer after the driver backup. The program supports the most widely used file systems. In fact, it has been tested with almost all modern systems, including Linux, Windows XP, Windows Vista, Windows 7, Windows 8, Windows 10, Mac OS, and others. The interface is extremely simple, and doesn't distract you from the tasks at hand. When choosing the source, you can select the full list of available drivers, or choose them individually, as well as copy their name to the clipboard. Then you can proceed with the backup procedure by specifying the output directory. If you opt for the batch mode, Driver Backup will save all the selected drivers in a single folder. But it still doesn't require a high-end computer. In our tests, it didn't slow down the computer and ran properly even on a slow machine with 2 GB of RAM. The program supports both 32-bit and 64-bit versions. It is highly recommended to use the latter, as some drivers have a 64-bit counterpart. In this case, you may need to select them in both list views and switch the destination folder, but that's a simple process. Once the backup is done, you can run the optional driver update. The program will automatically reinstall all the missing drivers in case you need them. The trial version of Driver Backup is fully functional, but if you want to back up multiple drivers, you will have to purchase the license. In fact, the trial version contains the basic functions with the complete list of drivers (except the ones from Microsoft) and supports only one output directory. The regular version, on the other hand, allows you to choose the destination folder and offers batch backup of all drivers. Driver Backup Pro Description: Driver Backup Pro is a rather sophisticated utility, which provides an easy and fast method of creating and restoring driver backups. The program can be handled by users who have a basic knowledge of computers. You just have to load a list of all the drivers and specify the output directory. The interface is very user-friendly, and there is no need to use extensive terminology. What's New In DriverExtractor?

----- DriverExtractor is a simple-to-use program that provides a backup solution to your computer's drivers. It can be handled even by users with minimal background in software applications. You can use it when reinstalling the operating system, in case you have lost the CD with the original drivers. The interface of the tool is based on a standard window with a plain layout, where a list of all installed drivers is automatically loaded upon initialization. This list shows the name, version, date and provider for each driver. Basically, you can select any item from it, specify an output directory (hard drive or USB flash disk, for instance), and let DriverExtractor proceed with the backup procedure. Unfortunately, only the registered version supports batch processing, so you cannot backup multiple drivers at the same time in the free edition. Once the task is done, you can check out log details in a plain text document. Furthermore, you can view only the present devices in the list or show the ones with drivers from Microsoft, check out device properties, as well as access Device Manager. There are no other options available through this program. DriverExtractor is pretty low-demanding when it comes to the system memory and CPU, hence it doesn't affect the computer's overall performance. It has a good response time and may take a while to backup a driver. But no error dialogs have been shown in our tests and the app did not hang or crash.
